The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 protein substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunospens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specifically expectation and/or amount specifically of hGDMLP proteins, as specific biomolecule and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 proteins, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and in vaccines or for replacement therapy. The disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed production of the present sequence and production of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

```
The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specifically of hGDMLP proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as proteins, as the probes for surface-enhanced laser desorption ionisation, as the respectic supplement in patients having specific deficiency in hGDMLP-1 proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   production, and in vaccines or for replacement therapy. The bodynucleotide sequences encoding hGDMLP-1 may be used for disgnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Shannon ME;

```

Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.

Claim 4; Page 135; 185pp; English.

```
The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule immens immunodeficiency virus (HIV) or a component of HIV, and antitrebumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ62216, ABZ64944 - ABZ65531, ABZ65220 - ABZ65224, ABZ655310 - ABZ65520 - ABZ65224,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     HIV-1 related binding molecule oligonucleotide sequence SEQ ID NO:375.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Hepatitis GB virus; HGBV; diagnosis; therapeutic; immunogenic; infection; detection; characterisation; hepatitis; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                          Double stranded hepatitis GB virus (HGBV) DNA obtd. from HGBV infected tamarin plasma, using standard procedures, was used too prepare a lambda phage HGBV cDNA library. cDNA clones rescued from the lambda phage and amplified using the PCR primers AAT00053-66, were searched against a sequence database and found to be unique HGBV sequences. Reagents which comprise the HGBV DNA, or its protein prods. can be used for the diagnosis, therapy or in a vaccine to prevent HGBV infection
                                                                                                                                                                                                                                                            Non-A, non-B, non-C, non-D, non-E Hepatitis virus reagents - useful for diagnosis and therapy of hepatitis GB virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Muerhoff AS, Pilot-Matias TJ, Buijk SL;

                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a collection of binding groups for a family of nucleic acids comprising members of relative high and relative low significance, where the binding groups are selected to be capable to identify, alone or in combination, essentially all members of the family of nucleic acids of relatively high significance. The collection of binding groups is useful for typing of nucleic acid in a clinical sample, by contacting the nucleic acid with the collection and determining whether one or more binding groups bound to the nucleic acid of the sample. This method is useful for determining whether the sample comprises at least a part of a member of relatively high significance of a family of nucleic acids. The collection of binding groups is useful for adisease caused by a pathogen containing a member of a family of nucleic acids. ABL88779 to ABL89321 represent oligonucleotide sequences used in the exemplification of the present

                                                                                                                        The present invention describe a method for detecting target hepatitis GB virus (HGBV) nucleic acid (THN) in a test sample (T) suspected of containing HGBV. The method involves reacting (T) with a HGBV polymucleotide probe (I) containing 15 contiguous nucleotides, and which selectively hybridises to the HGBV genome or its full complement, and detecting the complex that contains THN, indicating the presence of target HGBV. The method is used for detecting target HGBV nucleic acid in the test sample suspected of containing HGBV and for characterisation of newly ascertained etiological agent of non-A, non-B, non-C, non-D and non-E hepatitis causing agents collectively termed as hepatitis GB virus. AAAA55270 to AAAA55489 and AAB08985 to AAB09480 represent nucleotide and protein sequences used in the exemplification of the present invention. (Updated on 06-AUG-2003 to correct OS field.)
               Detecting target hepatitis GB virus nucleic acid in a test sample suspected of containing HGBV comprises reacting the test sample the HGBV polynucleotide probe and detecting the complex that contains target HGBV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents a PCR primer for DNA encoding the human semaphorin profein, designated DCSema, of the invention. DCSema is used for treating inflammatory diseases. DCSema ligands bind with VESPR to enhance or promote interleukin-12 (IL-12) production which induces an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Semaphorin; DCSema; human; inflammatory disease; VESPR; interleukin-12; IL-12; immune response; aggressive micrometastasising tumour; therapy; immune suppression; autoimmune disorder; semaphorin receptor; immune regulation; viral infection; PCR primer; ss.

immune response against aggressive micrometastasising tumours. They are dassociated with immune suppression of mature dendritic cells and therefore can be used for treating autoimmune disorders. They can be employed to measure biological activity of any semaphorin receptor in terms of its binding affinity for semaphorin ligand and also for detecting semaphorin receptor by in vitro assays. Decema polypeptides are used as reagents in quality assurance studies (to monitor shelf life and stability of semaphorin receptor under different conditions). They are also used as a research tool for studying the role of this ligand and its receptor in immune regulation and are also used as carriers for delivering diagnostic or therapeutic agents to cells expressing semaphorin receptor. They are shown to play a role as immune regulators
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a TSP1 (thrombospondin 1) domain-containing polypeptide comprising the proteins appearing as AAU80188 and AAU80189, encoded by cDNAs designated FGO6969 and FGO1896. Also included are proteins that are 50% homologous to the proteins and a polypeptide having at least one deletion, replacement, addition or insertion of amino acid in the proteins and having at least 8 repetitions of the TSP1 domain. The polypeptide can be use in drug compositions particularly for disorders associated with angiogenesis and vaculogenesis. The present sequence is
                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  TSP1; thrombospondin domain; DNA sequencing; primer; ss; FG06969; FG01896; angiogenesis; vasculogenesis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SEXEXEX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a compound targeted to the coding region of a nucleic acid encoding human dual specific phosphatase 8, where the compound specifically hybridises with the region and inhibits the expression of human dual specific phosphatase 8. The compound is useful for inhibiting the expression of human dual specific phosphatase 8 in cells or tissues, and for treating an animal, particularly a human, suspected of having or being prone to a disease or condition associated with expression of dual specific phosphatase 8. The compound is useful for diagnostics, therapeutics and as a research reagent, e.g. to prevent or delay infection, inflammation or tumour formation, and to distinguish between functions of various members of a biological pathway. This sequence represents an antisense oligonucleotide which inhibits
                                                                                                                                                                                                                                  Human; dual specific phosphatase 8; antisense; infection; inflammation;

ö The present invention relates to novel antisense oligonucleotides which are targeted to human acyl CoA cholesterol acyltransferase-2 (ACAT-2) mucleotide sequence (ACG42409-ACG4231), and mouse ACAT-2 (ACC42432-ACG42457). The antisense oligonucleotides specifically hybridise with and inhibit the expression of ACAT-2 nucleotide sequences (ACC42395 and ACC42402). ACAT enzymes catalyse the synthesis of cholesterol esters from free cholesterol and fatty acyl-CoA. The antisense oligonucleotides are useful for treating an animal which has a disease or condition associated with ACAT-2, e.g. a condition involving abnormal lipid metabolism, a /note= "Oligonucleotide has phosphorothioate backbone and all cytidine nucleotides are 5-methylcytidine. Optionally some nucleotides with 2'-methoxyethyl (2'-MOE wings) condition involving abnormal cholesterol metabolism, atherosclerosis, or Acyl CoA cholesterol acyltransferase-2; antisense therapy; antilipemic; antiarteriosclerotic; cardiovascular; ACAT-2; lipid metabolism; cholesterol metabolism; atherosclerosis; cardiovascular disease; phosphorothioate; mouse; ss. New antisense oligonucleotides for modulating acyl CoA cholesterol acyltransferase-2, e.g. for preventing or treating diseases associated with abnormal lipid or cholesterol metabolism, atherosclerosis, cardiovascular disease. Gaps Chimeric phosphorothioate oligonucleotide to target Navl.3 #1249. ö 1.0%; Score 15.4; DB 1; Length 20; 94.1%; Pred. No. 1e+02; ive 0; Mismatches 1; Indels

                                                                                                                                                                                                                                                                                                            The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Navl.3, where the antisense compound specifically hybridizes with and inhibits the axpression of Navl.3; The compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuragia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, archritic pain, acute pain, control of about not limited to an associated with a chidhood seizure disorder auch as childhood seizure disorder; including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothicate oligonuclectide with camen Navl.3 expression, the oligonuclectides are designed to target chimman Navl.3 expression, the oligonuclectides are designed to target clifferent regions of the human Navl.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The compound and composition are useful for treating a disease or condition associated with Navi.3, e.g. pain including but not limited to disease or condition. The composition pain herepetic neuralgia, chronic pain, lower back pain, pain from burns, migraine headache, cluster headache, mild-to-moderate but not limited to monatal or infantile epilepsy, or ataxia. The present a chimeric phosphorothioate oligonucleotide with sequence represents a chimeric phosphorothioate oligonucleotide with human Navi.3 expression, the oligonucleotides are designed to target different regions of the human Navi.3 RNA.
                                                                                                                                                                                                                                                                                                                    New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.

nucleic acid molecule encoding Navi.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navi.3. The compound and composition are useful for treating a disease or condition associated with Navi.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, pain from burns, migrainal neuropathy arthritic pain, lower back pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder; including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2,MOE wings and a deoxy gap. Used during the antisense inhibition of human Navi.3 expression, the oligonucleotides are designed to target Navi.3, useful for useful for treating a disease or condition associated with Navi.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia. New antisense compound targeted to a nucleic acid molecule encoding invention relates to an antisense compound targeted to Claim 4; SEQ ID NO 1532; 417pp; English

wew antisense compound targeted to a nucleic acid molecule encoding Navl.3, useful for useful for treating a disease or condition associated with Navl.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.

Claim 4; SEQ ID NO 1000; 417pp; English.

The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Navl.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navl.3. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention describes a compound, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding PPAR-alpha (peroxisome proliferatoractivated receptor-alpha), that specifically hypridises with the nucleic acid encoding PPAR-alpha comprising 86001-bp sequence and inhibits expression of PPAR-alpha comprising 86001-bp sequence and inhibits the expression of PPAR-alpha in cells or tissues; a method of screening for a modulator of PPAR-alpha; a diagnostic method for identifying a disease state; a kit or assay device comprising the compound; and a method of treating an animal having a disease or condition associated with PPAR-alpha. The oligonuclectide compound is useful for preparing a composition for treating hyperproliferative disorder e.g. cancer. This sequence represents a human peroxisome proliferator-activated receptor-alpha (PPAR-alpha) antisense oligonucleotide.
                   associated with Nav1.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, alabetic neuropathy, tripeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothioate oligonucleotide with 2'MOB wings and a deoxy gap. Used during the antisense inhibition of human Nav1.3 expression, the oligonucleotides are designed to target
compound and composition are useful for treating a disease or condition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       peroxisome proliferator activated receptor alpha; PPAR-alpha modulator; PPAR-alpha associated disorder; hyperproliferative disorder; human; antisense oligonucleotide; antisense technology; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                           Primers (AAQ50885-94) are used to amplify position 1 and 2 mutations at codon 12 of the k-ras gene. Primers (AAQ50885-89) are used to amplify position 1 mutation, while primers (AAQ50890-94) are used for the position 2 mutation. Primers (AAQ50895-04) can be used in ligase chain reactions, also used to detect the k-ras gene. (Updated on 25-MAR-2003 correct PN field.)

A method of detecting a mutant allele has been produced which involves; extracting DNA from a biological sample containing soluble DNA including a mutant allele of interest; contacting the DNA with a peptide nucleic acid (PNA) which is complementary to a segment of the DNA; amplifying the mutant allele in an allele-specific manner using at least a first set of allele-specific primars containing one primer complementary to a mutation-containing fragment of a first strand of the DNA and a first common primer for pairing during amplification to each allele-specific primer where the common primer is complementary to a segment of a second strand of the DNA distant with respect to the position of the first primer; and detecting the presence of the mutant allele. The present compared to the detection of mutated K-ras gene sequences in biological fluid where the mutation is present in the twelfth codon at position 2. The method is used to detect and also quantify soluble gene sequences especially in whole blood, plasma or serum, but also in utine, squeum, colonic effluent, fluid from endoscopic retrograde
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cholangeopancreatography, bone marrow, lymph and cerebrospinal fluid. The amount of soluble DNA is known to increase markedly in individuals with cancer and some other diseases, especially individuals with mutated K-ras alleles. Using a PNA complementary to the wild-type DNA blocks access of the primers to the wild-type sequences. This results in a significant decrease in false positives and allows for detection of mutant alleles in the presence of a 100000-fold excess of wild-type DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Detecting and quantifying mutant alleles in soluble DNA, esp. from blood - by amplification using peptide nucleic acid primer and allele-specific primer sets, useful for detecting e.g. cancer.
Mutant alleles; cancer; whole blood; plasma; serum; urine; sputum; colonic effluent; endoscopic retrograde cholangeopancreatography; bone marrow; lymph fluid; cerebrospinal fluid; ligase chain reaction; polymerase chain reaction; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gapa

                       Type I polyketide synthase; soil; lichen; antibiotic biosynthesis; humus; therapeutic; immunosuppressor; antitumour agent; pathogen; genetic diversity; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                             This sequence is a PCR primer used to amplify a Type I polyketide synthase from soil/lichen material. This protein is used in a method for the recovery of antibiotic biosynthetic DNA from humic materials or lichen. The PCR products have the potential to be used as therapeutic molecules including antibiotics, immunosuppressors and antitumour agents. The method allows access to the reservoir of genetic diversity in soil pathogenic micro-organisms, in order to find new antibiotics. It also allows access to novel biosynthetic genes/enzymes that can be used to produce antibiotics or produce specific compounds, enzymatically, in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                        New degenerate primers - used for recovering antibiotic biosynthetic {\tt DNA} from {\tt soil/lichen} material.

                                                                                                                                                                                                                                                                                                                ઠે
                                                                                                                                                                                                                                                                                                                                                 셤
                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                            The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as untoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, apparent enemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection. The present sequence represents a humanised HFETA-derived antites antibody heavy chain sequencing primer used in an exemplification of the invention. (Updated on 15-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Preventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autoimmune diseases, contains anti-Fas antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFB7A, or a humanised version of HFB7A containing identical CDRs (complementarity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; heavy chain; sequencing primer; ss.

The present sequence represente a humanised HFB7A-derived anti-Fas antibody heavy chain sequencing primer used in an exemplification of the invention. (Updated on 15-SEP-2003 to standardise OS field)
determining regions) to antibody HFE7A. Via its interaction with Fas, the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel humanized anti-Fas antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems.
                   antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment prevention of conditions such as autoimmune diseases, allergy, atopy,

antiartheumatic, nephrotropic, antiinfertility, neuroprotective, antiartheumatic, nephrotropic, antiinfertility, neuroprotective, antiarteriosclerotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic diseases associated with the Fas/Fas ligand system, especially systemic commia, Addison's disease, Slorgen's syndroderma, Goodpasture syndrome, Crohn's anemia, Addison's disease, cleroderma, Goodpasture syndrome, Crohn's cancina, Addison's disease, thrombopenia purpura, insulin dependent diabetes mellitus, alleray, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral CB, Cor D) or alcoholic), and transplant rejection. (I) selectively induce it in abnormal cells inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antisease, and have reduced risk of primer used in the construction of a humanised anti-rease. ö Fas; antibody; human; anti-inflammatory; anti-anemic; antidiabetic; dernatological; anti-arthritic; antiviral; immunomodulatory; cardiant; dermatological; immunosuppressive; thyromimetic; antirheumatic; anti-fream nephrotropic; antiinfertility; neuroprotective; antiarteriosolerotic; humanized; apoptosis; systemic lupus erythematosus; Hashimoto disease; rheumatoid arthritis; graft versus host disease; Sjorgen's syndrome; anemia; Addison's disease; scleroderma; sterility; Goodpasture syndrome; Crohn's disease; sterility; myasthenia gravis; multiple sclerosis; Basedow's disease; thrombopenia purpura; allergy; insulin dependent diabetes mellitus; arteriosolerosis; myocarditis; cardiomyopathy; glomerulonephritis; hepatitis; transplant rejection; Gaps immunomodulatory, dermatological, immunosuppressive, thyromimetic, designed heavy chain which is used in the method described in the .. immunomodulatory, dermatological, amunomoguressive, thyromimetto, antirheumatic, nephrotropic, antinfertility, neuroprotective, antirheumatic, nephrotropic, antinfertility, neuroprotective, antirheumatic, nephrotropic, antinfertility, neuroprotective, antianteriosclerofic, cardiant and hepatropic activity. (I) induce apoptosis by binding to call surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent disease associated with the Fas/Fas ligand system, especially systemic disease associated with the Fas/Fas ligand system, especially systemic lupus erythematosus, Hashimoto disease, rheumatoid arthritis, graft versus host disease, soleroderma, Goodpasture syndrome, Crohn's anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, autoimmune hemolytic anemia, sterility, mysathenia gravis, multiple sclerosis, Basedow's disease, trocmbopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they mimic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine entisease, and have reduced risk of inducing a human anti-murine antisease, and have reduced risk of inducing a human anti-murine antibody response. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                 molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human daxx inhibitory antisense phosphorothioate oligonucleotide SEQ:109
                     New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antisense oligonucleotide; daxx; inhibition; phosphorothioate; Fas binding protein; CENP-C binding protein; dap6; BAP; cytostatic; antiinflammatory; death associated protein 6; Ets-1 associated protein; inflammation; tumour formation; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           primer used in the construction of a humanised anti-Fas antibody HFE7A designed heavy chain which is used in the method described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                         This invention describes a novel humanized anti-Fas antibody-like

The present invention describes an antisense compound (I) up to 30 nucleobases in length, where (I) inhibits expression of daxx (also known as Fas binding protein, dapf for death associated protein, and EAP for Ets-1 associated protein). (I) has cytostatic and antiinflammatory activity, and can be used in antisense therapy and as a modulator of daxx. (I) is useful for inhibiting the expression of daxx in therapeutics for the treatment of diseases associated with the expression of daxx in therapeutics for the treatment of diseases associated with the expression of daxx prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation and as research reagent. The present sequence represents an inhibitory human daxx antisense phosphorothioate oligonucleotide which
                                                                            Novel antisense compounds capable of modulating expression of daxx useful for diagnosis, prophylaxis and treatment of diseases associated with expression of daxx.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel vaccine for treating cancer, especially prostate cancer, comprises immunogenic component which includes peptide mixture extracted from malignant cells which have altered immunogenicity.
                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immuno response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or firm to present sequence can also be used to redirect a Thi tumune response and to activate immune cells. Note: the present sequence may have a phosphorothioate backbone
             The present invention relates to a cancer vaccine. The cancer vaccine has an immunogenic component which includes a peptide mixture extracted from malignant cells which have an altered immunogenicity. The cancer vaccine is useful for treating cancer, preferably prostate cancer. The present sequence is a PCR primer, which was used to amplify human prostate specific antigen (PSA) DNA, for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Vaccine, cytostatic, virucidal, bactericidal, fungicidal, anti-parasitic, immunostimulatory, tumour; viral infection; bacterial infection; fungal infection; parasitic infection; cancer, asthma; infections disease; allergy, immune deficiency; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Vaccinating against tumors, infectious diseases, allergies and asthma using immunostimulatory Py-rich and TG nucleic acids.

Also included is a kit comprising a first conteainst housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, theumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal addessions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic

of cell surface antigens and antibodies. The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder cancer, brain and central nervous system (CNS) cancer, breast cancer, brain and central nervous system (CNS) cancer, breast cancer, colon and rectum cancer, connective tissue cancer, cesophageal cancer, lung cancer, kidney cancer, larynx cancer, leukaemia, liver cancer, lung cancer, Hodgkin's lymphoma, non-Hodgkin's lymphoma, melanoma, myeloma, oral cavity cancer, ovarian cancer, pancreatic cancer, prosetate cancer, rhabdomyosarcoma, skin cancer, stomach cancer, testicular cancer, rhabdomyosarcoma, skin cancer, stomach cancer, testicular cancer, and uterine cancer. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                    The present invention relates to methods for treating or preventing cancer, involving administering to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce expression
                                                                                                                                                                                          Treating or preventing cancer, such as basal cell carcinoma, comprises administering immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies to a subject having or at risk of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; androgen receptor complex-associated protein; ARCAP; primer; ss; androgen receptor; AR; cancer; liver tumour; cytostatic; PCR; transferrin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gapa

                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                          The invention relates to an androgen receptor complex-associated protein (ARCAP) sequence and the cDNA encoding it. The protein is useful for screening a compound that decreases AR-mediated (androgen receptor mediated) transactivation which involves contacting the ARCAP protein with a protein complex comprising an AR in the presence of a candidate compound, measuring the extent of binding between the polypeptide, and determining if the extent of binding is less than the extent of binding between the polypeptide and the protein complex in the absence of the candidate compound. The ARCAP DNA is useful for determining if a sample contains cancerous cells which involves providing a sample from a human patient and detecting ARCAP expression in the sample. The sequences are useful for determining whether a sample contains liver tumour cells. This sequence represents a human transferrin gene PCR primer used in a test
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; androgen receptor complex-coupled protein; ARCAP; PCR; primer; ss.
                                Novel substantially pure androgen receptor (AR) complex-associated protein which binds to AR and increases ability of AR to transactivate androgen-responsive gene, useful as drug target for treating liver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                of AR to transactivate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
responsing gene. The invention also describes a a vector containing the ARCAP polyvaucleotide sequence, and a host cell containing the ARCAP polyvaucleotide sequence. The ARCAP polypeptide can be used as a treating agent. The present sequence represents a PCR primer used in the example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a preventive or treating agent for diseases caused by abnormality in the Fas/Fas ligand system containing, as the active component, an antibody having a light chain subunit and a heavy chain subunit and an activity of combining specifically with mammalian Fas and an activity of inducing apoptosis in a cell expressing Fas. The agent has antiallergic, immunosuppressive and apoptotic activity and is used for preventing and treating autoimmune diseases, allergy, atopy and others. The present sequence is that of a PCR primer useful in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
```

RESULT 127

The present invention relates to the isolation of human androgen receptor complex-coupled protein (ARCAP), and the polynucleotide sequence encoding it. The ARCAP polypeptide complexes with an androgen receptor to increase

ABL48728 ID ABL4

```
The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates numbered for discrimination are mixed on each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal discrimination Nos. are mixed respectively in each wells of longitudinal critaria directions; (f) the mixed clones are cultured and the resultant cultures are amplified by using the above primer; (g) signals are detected from the amplified broducts; (h) the clones in the multiwell plates are specified from the amplified products; (h) the clones are content are applified by using the above primer; (g) and plates are specified from the detected result; and (i) the clones are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42957 to ABL45322 represent PCR primers for human chromosome 1936-35 DNA, and ABL45323 to ABL45634 represent PCR primers for human chromosome 21922.1, which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mycobacterium detection method; PCR; primer; probe; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mycobacterium tuberculosis-specific DNA sequence #27.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a preventive or treating agent for diseases caused by abnormality in the Fas/Fas ligand system containing, as the scrive component, an antibody having a light chain subunit and a heavy chain subunit and an activity of combining specifically with mammalian Fas and an activity of combining specifically with mammalian sgent has antiallergic, immunosuppressive and apoptotic activity and is used for preventing and treating autoimmune diseases, allergy, atopy and others. The present sequence is that of a PCR primer useful in the construction of anti-Fas antibodies of the invention

The sequences given in ABA00075 and ABA00083-85 are probes and primers which were used in the detection of H. pylori infection pre- and post-treatment in a patient, compared to the presence of human DNA. These sequences may be used in the method of the invention for detecting a H. pylori infection. The method comprises: (a) determining an integrity of a Helicobacter pylori nucleic acid present, or (b) amplifying and detecting a first, second or third Helicobacter pylori nucleic acid at least 200, infection if the integrity of the nucleic acid as predetermined threshold, or if the amplified first, second or third Helicobacter pylori nucleic acids are detected. The method is useful for detecting a
                                                                                                                       The invention comprises a method for detecting the presence of a microorganism (particularly Mycobacterium tuberculosis) in a test sample. The method of the invention comprises exposing the test sample to an inducer that is capable of inducing the expression of at least one gene in the micro-organism and then testing for the presence of mRNA from this gene micro-organism and then testing for the presence of mRNA from this gene expressed in a species of Mycobacterium (e.g. Mycobacterium tuberculosis). The present DNN sequence represents a Mycobacterium specific nucleotide which can be used as a primer or probe in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Detecting, grading and/or monitoring a Helicobacter pylori infection by detecting a high-integrity H. pylori nucleic acid in a patient sample.
                   Detecting the presence of Mycobacterium tuberculosis in a test sample, comprises inducing mRNA expression of Mycobacterium tuberculosis and
                                                                                                                                                                                                                                                                                                                                                                                                                    ..

Helicobacter pylori infection, determining its status, monitoring progression, evaluating efficacy of a treatment and diagnosing gastric disease by detecting a high-integrity Helicobacter pylori nucleic acid in a patient sample. Prior methods of using polymerase chain reaction (PCR) in assays detecting H. pylori infection usually lack the specificity to distinguish a successfully treated patient from a patient with a continuing H. pylori infection. The present invention of non-invasive method uses more sensitive and more specific assays to test for and to monitor H. pylori infection and course of treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Hepatotrophic; immunomodulatory; cytostatic; antiinflammatory; hepatitis; haemostatic; BH3 interacting domain death agonist; liver disease; haematopoictic disorder; developmental disorder; immunological disorder; hyperproliferative disorder; apoptosis; human; chimeric; 2'-methoxyethyl; 2'-MOB; phosphorothioate backbone; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a compound 8 to 50 nucleotides in length targeted to a nucleic acid molecule encoding a BH3 interacting domain death agonist, where the compound specifically hybridises with and inhibits the expression of the BH3 interacting domain death agonist. The compound of the invention is useful for inhibiting the expression of the BH3 interacting domain death agonist in cells or tissues. The compound is also useful for treating an animal having a disease or condition associated with the BH3 interacting domain death agonist, e.g. haematopoietic disorder, hyperproliferative disorder, a developmental disorder, immunological disorder, or a disease or condition of the liver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel antisense compound targeted to nucleic acid molecule encoding the BH3 interacting domain death agonist, useful for treating animals with diseases associated with BH3 interacting domain death agonist, e.g.
                                                                                                                                                                                                                                                                               Gaps

e.g., hepatitis, or a condition associated with apoptosis. The compound reagent for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents an antisense oligonucleotide inhibitor of the DNA from human BH3 interacting domain oligonucleotide inhibitor of the DNA from human BH3 interacting domain oligonucleotide inhibitor of the polynum home. This sequence is a chimeric oligonucleotide 20 nucleotides in length, which is flanked on both sides by five-nucleotide wings. The wings are composed of 2'-methoxyethyl (2'-methoxyethorechioate (P-S) throughout the oligonucleotide. (Updated on 29-AUG -2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a preventive or treating agent for diseases caused by abnormality in Fas/Fas ligand system containing as the active component an antibody having as the light chain subunit a polypeptide containing residues 1-218 of one of 3, 39 residue amino acid sequences, or residues 1-451 of one of 3, 470 residue amino acid sequences, fully defined in the specification and having an activity of combining
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     specifically with mammalian Fas and an activity of inducing apoptosis in a cell expressing Fas and antiallergic activity and is used for preventing and treating autoimmune diseases, allergy, atopy and others. The present sequence is that of a PCR primer,
                                                                                                                                                                                                                                                                                                               Gaps

The invention relates to a preventive or treating agent for diseases caused by abnormality in Fas/Fas ligand system containing as the active component an antibody having as the light chain subunit a polypeptide containing residues 1-218 of one of 3, 239 residue amino acid sequences, or residues 1-451 of one of 3, 470 residue amino acid sequences, fully defined in the specification and having an activity of combining specifically with mammalian Fas and an activity of inducing apoptosis in a cell expressing Fas. The agent has immunosuppressive and antiallergic activity and is used for preventing and treating autoimmune diseases, allergy, atopy and others. The present sequence is that of a PCR primer, useful to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Drug containing humanized anti-Fas antibody, used for preventing and treating autoimmune diseases, allergy, and atopy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Immunostimulatory; antiinflammatory; dermatological; antipsoriatic;

                                                                                                                                                                                                                                                                                     The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic contact dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative collitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated polypeptide micro-scaffold displaying immunoglobulin complementarity determining region (CDR)-2 or CDR3 polypeptide sequences, comprising a CDR2 or LDR3 polypeptide sequence interconnecting fragments of the adjacent framework polypeptide sequences, which are arranged to form two anti-parallel beta-strands. The polypeptide micro-scaffold and the nucleotide sequences are useful for searching, selecting and screening for immunoglobulin CDR2 or CDR3 polypeptide sequences. The present sequence is a PCR primer used in the amplification of human HCDR3 DNA.
New isolated polypeptide micro-scaffold displaying immunoglobulin complementarity determining region (CDR) 2 or CDR3 polypeptide sequences, useful for searching, selecting and screening for immunoglobulin CDR2 or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         immunostimulatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament

prime reventation assay, useful for analysing molecular events for identifying mutations indicative of cancer, by contacting a target uncleic acid primer complementary to a region of the target nucleic acid primer complementary to a region of the target uncleic acid primer complementary to a region of the target nucleic acid primer complementary to a region of the target nucleic acid, and extending the primer in the presence of a first nucleic acid, and extending the primer in the presence of a first nucleotide that is complementary to a first variant nucleotide suspected to be at a position downstream of the region and a second nucleotide that is complementary to a second variant nucleotide at the position, thus to reduce misincorporation of the first nucleotide on a template comprising the second variant nucleotide. The methods are useful for analysing the second variant nucleotide. The methods are useful for analysing the second variant nucleotide. The methods are useful for analysing the encomence by a particularly useful in detecting are mutation in a heterogeneous biological sample (e.g. sporadic mutation in a heterogeneous patient sample), detecting rare genotypes in genotyping reactions (e.g. viral genotyping reactions), or detecting mutation in a sequence variations in pooled samples (e.g. detecting polymorphisms or inherited sequence represents a primer used as part of the primer extension assay
                                                                                                      ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detecting a variant in a primer extension assay, useful for analyzing abolecular events for identifying mutations indicative of cancer, by contacting a target nucleic acid primer complementary to a region of the target nucleic acid.

EPIG-) EPIGENESIS PHARM INC

Katz E, Pabalan J, Aguilar D; Li Y, Sandrasagra A, K. Tang L, Shahabuddin S; Nyce JW, Miller S,

WPI; 2003-229219/22.

Pharmaceutical composition for treating ailments associated with impaired g respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid ubiquinone.

Claim 15; SEQ ID NO 347; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation coodon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genee encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an natianflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallargic, antiasthmatic, hypotenaive, immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is seful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition

Pharmaceutical composition for treating ailments associated with impaired or respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid ubiquinone.

Claim 15; SEQ ID NO 1294; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the instantion cooding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of unctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antialergic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of adenosine of or reducing bronchoodilation, increasing levels of adenosine receptor, producing pronchoolation, increasing bronchoconstiticion. Ung surfactant in a subject's tissue, or treating bronchoconstiticion.

Pharmaceutical composition for treating ailments associated with impaired ö respiration, has oligo(8) antisense to specific gene(8) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid ubiquinone.

Disclosure; SEQ ID NO 4232; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antiense to the initiation codon, coding region, 5 or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal alrawy dysfunction and a second active agent comprising an antinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallargic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of, or reducing sensitivity to adenosine, reducing levels of, or reducing sensitivity to adenosine, reducing levels of, or reducing bronchodilation, increasing bronchoconstriction, lung surfactant in a subject's fissue, or a respiratory disease or condition.

```
first active agent comprising an oligonuclectide antisense to the first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5 or 3' end genomic flanking regions, 5 and 3' intron-exon junctions, or regions within 2-10 nuclectides of unctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinons. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also artiinflammatory steroid in a subject, for reducing levels of, or reducing sensitivity to adenosine, reducing levels of, or reducing sensitivity to adenosine, reducing levels of, or reducing bronchodilation, increasing levels of adenosine tung surfactant in a subject's tissue, or a respiratory disease or condition.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to novel antisense oligonucleotides which are targeted to human acyl CoA cholesterol acyltransferase-2 (ACC47-2) nucleotide sequence (ACC42409-ACC44131), and mouse ACAT-2 (ACC4242) inhibit the antisense oligonucleotides specifically hybridise with and ACC42403. ACAT enzymes catalyse the synthesis of follesterol seters from free cholesterol and fatty acyl-CoA. The antisense oligonucleotides are useful for treating an animal which has a disease or condition associated with ACAT-2, e.g. a condition involving abnormal lipid metabolism, a cardiovascular disease
Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at fer wind in the world.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       comprising oligonuclectes, a note that a new comprising oligonuclectes, a new comprising oligonuclectes, and the new comprising oligonuclection, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonuclectides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonuclectides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel composition (a) a first active agent

oligonucleotide containing less percentage of adenosine, targeted t nucleic acids associated with lung airway or lung dysfunction, and Pharmaceutical composition for treating asthma, has antisense bronchodilating agent.

Claim 15; SEQ ID NO 1294; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating

23-APR-2002; 2002WO-US013143. 24-APR-2001; 2001US-0286036P. (EPIG-) EPIGENESIS PHARM INC. Pharmaceutical composition for treating asthma, has antisense

composition, and commonsuppressive and cycostatic activity, is beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administrated composition comprises of malignant disease. The administrated composition comprises oligo and is administrated to reduce the production or availability, or to increase the degradation of the target mRNA or to creduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung or inflammation, allergies and/or bronchoconstriction and/or lung or inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, cinflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic thinitis, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system cent. Index, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it ö expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides (c) instructions for adding a carriar and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, Human, antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallargic, antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cycostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory districtses syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ss; primer. This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating largies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, confidenceonstruction, respiratory tract inflammation, allergies and confidence associated with lung airway or lung expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that composites: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiastrmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or bronchoconstriction and/or lung with a disease or condition such as pulmonary vasconstriction, and/or bronchoconstriction and/or inflammation, allergies and/or bronchoconstriction and/or lung inpeded respiratory diserses syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation rejection, pulmonary incedections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that faree adenosine into the system content of the allergies adenosine content of the anti-sense oligos corresponding to the oligonucleotides into product that faree adenosine into product the term and unallergies are of the confidence adenosine content of the allergies 
oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and

WO200285309-A2

31-OCT-2002.

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating reducing adenosine sensitivity. Personal alleviating reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, configuration or hyposecretion, when administered to a mammal. The colligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung expression or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kir, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kir. The composition analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adreneratic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or surfactant hypoproduction are associated inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vessentiation. inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it Gaps Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted toucleic acids associated with lung airway or lung dysfunction, and Pabalan J, Aguilar D; ö Ouery Match 1.0%; Score 15.2; DB 1; Length 20; Best Local Similarity 85.0%; Pred. New antisense oligonucleotide for modulating endothelial lipase expression, for diagnosing, preventing or treating e.g. dyslipidemia, low high density lipoprotein or cardiovascular disorders.
                                                                                                                                                                                                                                                       The present invention relates to antisense oligonucleotides (ADD151603-ADD25510) targeted to human Endothelial Lipase (EL) coding sequence (ADD25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoportein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1.0%; Score 15.2; DB 1; Length 20; 85.0%; Pred. The nucleic acid may also be used for treating cystic kidney disease. The current sequence is that of a PCR primer used during mutational analysis
                                                                                                                                                                                                                                                                                                                                                                    drug
                                                                                                                                       PCR primer 40 used during mutational analysis of human nephroretinin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel isolated and purified nucleic acid.
                                                                                                                                                                                                                                                                                                           Hiller KS;

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to 9434.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1, in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulator, cardiant, neuroprotective, ophthalmological, immunomodulatory and cardiovascular activities, and can ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immicrosomal prostaglandin E2 synthase inhibitor; cytostatic; antidiaheric; nurciprotective; antidiahericic; antidiamatory; neuroprotective; nootropic; antiarthritic; vasotropic; ophthalmological;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an antisense compound 8-30 nucleobases in length targeted to a nucleic acid molecule encoding Farnesoid X receptor (FXR), where the antisense compound specifically hybridizes with and inhibits the expression of FXR. The composition and methods are useful for inhibiting the expression of FXR (Farnesoid X receptor) in cells or tissues, or for treating diseases or conditions associated with FXR, such as diabetes, immunological disorders, cardiovascular disorders, e.g. dyslipidemia and its symptoms, atheroscierosis, low HDL (high density lipoprotein), elevated LDL (low density lipoprotein) or hypercholesterolemia, gallstones, hypertidemia, obesity, neurological disorders, or ischemia/reperfusion injury. In addition, the composition is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence corresponds to an antisense oligonucleotide of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to novel antisense oligonucleotides which are targeted to human acyl CoA cholesterol acyltransferase-2 (ACC47-2) nucleotide sequence (ACC42409-ACC4311), and mouse ACAT-2 (ACC42403-1) and mouse ACAT-2. (ACC42403-1) and mouse ACAT-2. (ACC42403-1) and mouse acceptance (ACC42403-1) and mouse oligonucleotides specifically hybridise with and ACC424203-1). ACAT enzymes catalyse the synthesis of cholesterol segress from free cholesterol and fatty acyl-CoA. The antisense oligonucleotides are useful for treating an animal which has a disease or condition associated with ACAT-2, e.g. a condition involving abnormal thind metabolism, a condition involving abnormal cholesterol metabolism, a condition involving abnormal sequence is a PCR primer for human
                                                           Acyl CoA cholesterol acyltransferase-2; antisense therapy; antilipemic; antiatreficosferotic; cardiovascular; ACMT-2; lipid metabolism; cholesterol metabolism; archerosclerosis; cardiovascular disease; phosphorothioare; human; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense oligonucleotides for modulating acyl CoA cholesterol acylicransferase.2, e.g. for preventing or treating diseases associated with abnormal lipid or cholesterol metabolism, atherosclerosis, cardiovascular disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; epidermal growth factor receptor; EGFR; EGF-R; target sequence;

                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes enzymatic nucleic acid molecules (NAMS) which specifically cleave RNA derived from an epidermal growth factor receptor (EGF-R) gene. AAV97221 to AAV98043 and AAV98979 to AAV99090 represent specifically claimed target sequence from human EGF-R. AAV98044 to AAV98866 and AAV98867 to V9878 represent hammerhead ribozymes and hairpin ribozymes respectively for human EGF-R. The NAMS are useful for cleaving EGF-R RNA in the treatment of a condition associated with EGFR expression levels e.g. to inhibit call proliferation in the prevention or treatment of cancers. The NAMS can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of EGF-R RNA in a cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                       Enzymatic nucleic acids - which cleave RNA derived from an epidermal growth factor receptor, useful for inhibiting cell proliferation and for treating cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed remucleic acid decoy molecules and apteamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HGV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HV infection, replication and gene chases teates related to HBV and HV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocallular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      carcinoma. The present sequence represents a substrate for one of the HBV ribozyme, inozyme, G-cleaver, zinzyme, DNAzyme or amberzyme sequences disclosed in the present invention
                                                                                                                                                                                                                                       Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

the synthesis, expression and/or stability of Hepatitis G virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, Cardenzymes, amberzymes, antisense, and enzymes, antisense, and enzymes, antisense, and c-leaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonuclectides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV Compounds and HBV and compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and the achods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinal relations of antisers of antisers of an entitle for the compounds and carcinoms. The present sequence represents a substrate for one of the HBV carcinoms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus

protein.

```
The invention relates to an isolated human GTP-activator protein for Rablike GTPase (GAPN) polypeptide (1), a sequence having 65% identity to (1), a sequence in which at least 95% of deviations from (1) are conservative substitutions, or a fragment of at least 8 contiguous amino acids of (1). The polypeptide is useful for identifying a specific binding partner for itself, by contacting the polypeptide in vivo to a potential binding partner and determining if the polypeptide binding partner binds to the polypeptide. (1) and a nucleic acid encoding the polypeptide (II) are useful for diagnosing or monitoring a disease caused by altered expression of GAPN, by determining the level of expression of GAPN, by determining the level of expression of GAPN, by determining the level of expression of GAPN, added and subject subspected to have the disease, alterations from a normal level of subsected to have the disease, alterations from a normal level of associated with decreased expression or activity of GAPN, and an antagonist of (1) is useful for treating or preventing a disorder associated with increased expression or activity of GAPN, and an antagonist of (1) is useful as immunogen to raise antibodies that specifically recognize GAPN proteins. (II) is useful to raise antibodies that specifically recognize GAPN proteins. (II) is useful to raise antibodies that specifically recognize GAPN nucleic acids in and isolate GAPN nucleic acids from both genomic and transcript-derived nucleic acids samples. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  represents a 17-mer oligonucleotide spanning the GAP_N DNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

15-JAN-2004 (first entry)

```
The invention relates to an isolated human GTP-activator protein for Rablike GTPase (GAPN) polypeptide (I), a sequence having 65% identity to (I), a sequence in which at least 95% of deviations from (I) are conservative substitutions, or a fragment of at least 8 contiguous amino acids of (I). The polypeptide is useful for identifying a specific binding partner for itself, by contacting the polypeptide in vivo to a potential binding partner and determining if the polypeptide in vivo to a potential binding partner and determining if the polypeptide binding partner binds to the polypeptide. (I) and a nucleic acid encoding the polypeptide (II) are useful for diagnosing or monitoring a disease caused by altered expression of GAPN, by determining the level of expression of GAPN, by determining the level of expression of GAPN, by determining information. (I), (II) suspected to have the disease, alterations from a normal level of expression providing diagnostic and/or monitoring information. (I), (II) or agonist of (I) is useful for treating or preventing a disorder associated with increased expression or activity of GAPN, and an antagonist of (I) is useful for treating or preventing a disorder associated with increased expression or activity of GAPN (all claimed).

(I) is useful as immunogen to raise antibodies that specifically recognize GAPN proteins. (II) is useful to drive in vivo expression of GAPN proteins, and as hybridization probes to detect, characterize and quantify GAPN nucleic acids in and isolate GAPN nucleic acids sin and isolate acids sequence.

Tepresents a 17-mer oligonucleotide spanning the GAPN NNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel human GTP-activator protein for Rab-like GTPase and polynucleotide encoding the protein, useful for diagnosing, treating or preventing disorders associated with increased expression or activity of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1.0%; Score 15; DB 1; Length 17;

The invention relates to an isolated human GTP-activator protein for Rab-
[1], a sequence having 65% identity to
[1], a sequence in which at least 55% of deviations from [1] are
[2] as sequence in which at least 55% of deviations from [1] are
[3] conservative substitutions, or a fragment of at least 8 contiguous amino
[3] caids of [1]. The polypeptide is useful for identifying a specific
[4] caids of [7]. The polypeptide is useful for identifying a specific
[5] chinding partner for itself, by contacting the polypeptide in vivo to a
[6] conservation partner and determining if the polypeptide binding
[7] contact binds to the polypeptide. [7] and a nucleic acid encoding the
[7] partner binds to the polypeptide. [7] and a nucleic acid encoding the
[7] contact partner of CAPN, by determining the level of expression of
[7] contact of nucleic acids or proteins that derives from a subject
[7] cauge of nucleic acids or proteins that derives from a subject
[7] cauge of nucleic acids or proteins information. [7], [7]
[8] contact of list useful for treating or preventing a disorder
[8] associated with decreased expression or activity of GAPN, and an
[8] cassociated with increased expression or activity of GAPN, and an
[8] cassociated with increased expression or activity of GAPN (all claimed).
[8] cassociated with increased expression or activity of GAPN (all claimed).
[9] cassociated with increased expression or activity of GAPN proteins.
[9] cassociated with a simmunogen to raise antibodies that specifically
[9] cacconize GAPN proteins. [11] is useful to drive in vivo expression of accounting a disorder and antify GAPN proteins, and as Nybridization probes to detect. characterize and
[9] quantify GAPN nucleic acids in and isolate GAPN nucleic acids from both
[9] genomic and transcript-derived nucleic acid samples. This sequence.
[8] capter and as Nybridization probes to detect. Characterize and genomic and transcript-derived nucleic acid samples. This sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel human GTP-activator protein for Rab-like GTPase and polynucleotide encoding the protein, useful for diagnosing, treating or preventing disorders associated with increased expression or activity of the

The invention relates to an enzymatic nucleic acid molecule that specifically cleaves RNA derived from hepatitis B virus (HBV) and comprising one or more binding arms, without requiring the presence of a 2.0H group within the molecule for activity. The nucleic acids are useful for treating hepatitis B virus infection, hepatitis, hepatocellular carcinoma, cirrhosis and liver failure, either alone or in combination with other therapies such as lamivudine and interferons. The nucleic acids are useful as diagnostic tools to examine genetic drift and mutations within diseased cells, for detecting the presence of HBV RNA in a cell, for the study of RNA and for down-regulating gene expression of target genes in bacterial, fungal, viral, plant or mammalian cells. This sequence represents an HBV RNA target sequence, used in the scope of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at seqdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel enzymatic nucleic acid molecule such as DNAzymes and inozymes specifically cleaving RNA derived from hepatitis B virus and comprising one or more binding arms, useful for treating hepatitis and cirrhosis.
                                                             Hepatitis B virus; HBV; ss; enzymatic nucleic acid; RNA cleavage; pepatitis B virus infection; hepatitis; hepatocallular carcinoma; cirrhosis; liver failure; lamivudine; interferon; genetic drift; virucide; hepatotropic; antinflammatory; cytostatic.
                      Hepatitis B virus (HBV) RNA target seguence #845.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mcswiggen JA, Morrissey

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            nucleic acids are useful as diagnostic tools to examine genetic drift and mutations within diseased cells, for detecting the presence of HBV RNA in a cell, for the study of RNA and for down-regulating gene expression of target genes in bacterial, fungal, viral, plant or mammalian cells. This sequence represents an HBV RNA target sequence, used in the scope of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at seqdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an enzymatic nucleic acid molecule that specifically cleaves RNA derived from hepatitis B virus (HBV) and comprising one or more binding arms, without requiring the presence of a 2'-OH group within the molecule for activity. The nucleic acids are useful for treating hepatitis B virus infection, hepatitis, hepaticis, nepaticis negations, cirrhosis and liver failure, either alone or in combination with other therapies such as lamivatine and interferons. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              specifically cleaving RNA derived from hepatitis B virus and comprising one or more binding arms, useful for treating hepatitis and cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel enzymatic nucleic acid molecule such as DNAzymes and inozymes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         THE LITTLE LITTL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes classification of the type of hepatitis B virus (HBV) involving checking if the 22nd nucleotide (22nt) in the S gene is cytosine, to distinguish the gdaz type of HBV from other types. Also described are: (1) a method as above for distinguishing the gdaz type gene, involving checking if the 166nt, 169nt, 176nt and 390nt are adenine, thymine, guanine or cytosine respectively; (2) a method as above for distinguishing the gdwl type gene, involving checking if the 392nt is adenine; (3) a method as above for distinguishing the gyw type gene involving checking if the 401nt is adenine; and (4) a method as above for distinguishing the grape gene distinguishing the gdr type gene involving checking if the 328nt is cytosine and if the 337nt is adenine. The method can classify HBV easily to match with clinical symptoms. The present sequence represents a probe

pcr primers AA237842-237845 are used in the amplification of epidermal growth factor receptor (BGFR) cDNA from tumour cells. These primers are used to identify BGFR deletion mutant. Deletions in the EGFR gene are found in many gliomas, breast tumours and lung tumours. The nuclectide and amino acid sequence (AA237841 and Y5189) of the type II EGFR deletion mutant are used in the invention to create vectors containing the probes for the type II EGFR mutant. The invention also relates to a kit for detecting type II mutants. A cell sample taken from an individual can be section for the presence of a tumour, in particular breast cancer, lung cancer or gliomas using probes for type II mutants. A cell sample taken from an individual can be radiolabelled or labelled with fluorescent material and hybridization to a deletion-specific probe indicates the presence of the can be radiolabelled or labelled with fluorescent material and hybridization to a deletion-specific probe indicates the presence of the used time associated with the tumour. Diagnosis could also be carried out using a polymerase chain amplification technique. The sequences can also be used for the generation of antibodies which can be used to treat these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Rat; PTP1B; protein phosphatase 1B inhibitor; antisense; gene therapy; infection; inflammation; tumour; prophylaxis; phosphorothioate; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                   ô
                                                                                                                                                                                                                                                                      The invention is directed to antisense compounds, particularly oligonucleotides which are targetted to a DNA encoding protein phosphatase 1B (PTP1B) to modulate its expression. The antisense compounds are useful for diagnosis, prophylaxis and treatment of diseases associated with the expression of PTP1B, to prevent or delay infection, inflammation and tumour formation and as a research reagent. The PTP1B DNA is useful in gene therapy. The present sequence is an antisense oligonucleotide with a phosphorothicate backbone. This oligo is targetted to rat PTP1B to inhibit its expression
                                                                                                                                                                                                            New antisense compounds capable of modulating expression of human protein
                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, epidermal growth factor receptor; hyperproliferative disease;

The invention relates to an antisense oligonucleotide targetted to a nucleic acid molecule encoding human epidermal growth factor receptor (Herl) to inhibit its expression. The antisense compounds are useful for treating diseases or conditions associated with Her-1 such as hyperproliferative diseases especially cancer (lung, ovarian, colon or prostrate cancer) and psoriasis. They are also useful as research reagents, diagnostics, therapeutics, kits and prophylactically e.g. to prevent or delay tumour formation. The present sequence is an antisense oligonucleotide targetted to human Her-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel antisense oligonucleotide that specifically hybridizes with and inhibits nucleic acid encoding epidermal growth factor receptor, useful for treating hyperproliferative disease such as cancer or psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention relates to a compound of 8-50 nucleobases in length
targeted to a nucleic acid encoding protein phosphatase 1B (PTP1B), where
the compound specifically hybridises with and inhibite the expression of
PTP1B (e.g. an antisense oligonucleotide). Also included are (1) a
PTP1B (e.g. an antisense oligonucleotide). Also included are (1) a
Compound of 8-50 nucleobases in length which specifically hybridises with
comprising contacting the expression of PTP1B in cells or tissues
comprising contacting the expression of PTP1B in cells or tissues
comprising or suspected of having a disease or condition associated
with PTP1B comprising administering the compound; (4) decreasing blood
sugar levels in an animal comprising administering the compound; (5)
preventing or delaying the onset of a disease or condition associated
conventing or delaying the onset of an increase in blood glucose levels
in an animal comprising administering the compound. The compound is used
convent or delay the onset of a disease or condition associated with
PTP1B, such as type 2 diabetes, obesity, cancer (especially ovarian
animal having or suspected of having the disease or condition, and for
decreasing blood sugar levels or preventing or delaying the onset is also used
increase in blood glucose levels in an animal, the compound of a larger levels or preventing or delaying the onset of an increase in blood glucose levels in an animal having or suspected of having the disease or condition, and for
increase in blood sugar levels or preventing or delaying the onset of an increase or condition, and for
increase in blood sugar levels in an animal in the onset of an increase or condition, and for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 diagnostics, therapeutics, prophylaxis, and in research reagents and ts. The present sequence is an antisense compound of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Compound for inhibiting the expression of protein phosphatase 1B (PTP: and for treating diabetes, cancer, or obesity, comprises an antisense oligonucleotide targeted to nucleic acid encoding PTP1B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 16; Page 24; 133pp; English

The invention relates to a compound targeted to a nucleic acid molecule encoding protein phosphatase IB (PTPIB), which specifically hybridises with and inhibite the expression of PTPIB. The compounds of the invention are useful for inhibiting the expression of PTPIB in liver, kidney or adipose cells or tissues and for treating an animal, preferably human, having a disease or conditions associated with PTPIB, including metabolic diseases or conditions such as cancer. The sequences are also useful for decreasing blood (serum or plasma) glucose levels in an animal e.g. a diabetic human or rodent, for preventing or delaying the onset of a disease or condition associated with PTPIB, and for preventing or delaying the onset of an increase in blood glucose levels. This sequence represents a PTPIB mRNA level inhibition antisense oligonucleotide of the Novel antisense compound useful for treating type 2 diabetes, cancer and obesity, is targeted to nucleic acid encoding human protein phosphatase 1B, and hybridizes and inhibits PTP1B expression. The invention features to an instruction and interior spirite spirite in the invention features to an instruction of the single nucleotide polymorphisms given in the specification, a nucleotide sequence having at least 15 contiguous nucleotides of them, or complements of them. The genes are ADAM19 (a disintegrin and metalloprotease 19, also known as gene 845), NRG2 (neuroregulin 2, also known as gene 847), endophilin 2 (also known as gene 847), endophilin 2 (also known as gene 803) and ADAMTS2 (a disintegrin and metalloprotease vith thrombospondin typel motif 2, also known as gene 962). Also included are a vector comprising the isolated nucleic acid (or alternate splice variant), a host cell containing the vector, an isolated polypeptide encoded by the novel nucleic acid (or alternate splice variant), an antibody or antibody fragment that binds to the polypeptide. The pharmaceutical compositions (comprising the nucleic acid or alternate splice variant, and a carrier, splice variant, vector, polypeptide or antibody, and a carrier, splice variant, and at least one component to detect the hybridisation of the variant or the binding of the antibody to an ADAM gene amino acid sequence), a kit for detecting an antibody or antibody rangement, and at least one component to detect the hybridisation of the variant or the binding of the antibody to an ADAM gene amino acid sequence (comprising the antibody to antibody or antibody to an ADAM gene amino acid sequence (comprising the antibody or an isolated mucial acid probe or primer comprising at least 8 contiguous mucleotides of the nucleic acid, an isolated antisense nucleic acid, identifying an ADAM or interactor gene ligand and an isolated nucleic acid variant of Gene 803, 845, 847, 847, 87 or 962. The nucleic acid or alternate splice variants, methods, kits and antibody/antibody fragment associated disorder, e.g. asthma, atopy, obesity or inflammatory bowel disease. The present sequence is a primer used to sequence the regions an orthologue of a human ADAM or interactor gene, treating an ADAM or interactor gene, treating an ADAM or interactor gene, treating an ADAM or interactor gene-associated disorder (or a respiratory disorder) by administering the pharmaceutical composition, a transgenic mouse (whose genome comprises an introduced null mutation in an endogenous gene that is orthologous to a human ADAM gene), making a homozygous transgenic for more is forming a crystal of the isolated polypetide, a cell line comprising the isolated nucleic acid or alternate splice variant, a biochip comprising the isolated nucleic acid or alternate splice variant, diagnosing an ADAM or interactor gene-associated disorder or a respiratory disorder in a human subject, determining an ADAM or interactor gene pharmacogenetic profile in a human subject, identifying The invention relates to an isolated nucleic acid or alternate splice New isolated nucleic acid or alternate splice variant, useful for diagnosing and treating a disintegrin and metalloprotease (ADAM) or interactor gene-associated disorder, e.g. asthma, atopy, obesity or inflammatory bowel disease. This invention relates to novel compositions and methods for modulating the expression of PTPIB (also known as protein phosphatase 1B and PTPNI). Specifically, it refers to antisense compounds that can target and hybridise with a nucleic acid molecule encoding PTPIB, as well as splice variants thereof and inhibit expression accordingly. PTPIB is a tyrosine phosphatase that plays an essential regulatory role in signalling mediated by the insulin receptor and as such is useful for treating diseases such as type 2 diabetes and obesity. Furthermore, PTPIB can suppress transformation of oncogenic genes, such that compositions of this invention can also be used to treat hyperproliferative conditions including cancer. Accordingly, these compounds can be described as having cytostatic, antidiabetic and anorectic activities. This oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /mod_base= OTHER

The present sequence is a primer which was used for reverse transcription of rat RNA in order to study the tissue distribution of the rat D4 dopamine receptor mRNA. A cDNA encoding the rat D4 dopamine receptor mRNA. A cDNA encoding the rat D4 dopamine receptor was expressed in transfected mammalian cells and shown to preferentially bind dopamine antagonists such as clozapine. The CDNA is useful for screening drugs which specifically bind to the receptor and have selective effects on the cardiovasculature and retinal tissues through interactions with the receptor. Such compounds may act as vasoregulators or may have ionotropic effects. The D4 receptor protein may be used for the production of polyclonal or monoclonal antibodies which recognise the D4 receptor sequence but do not recognise other dopamenergic receptors. The antibodies may be used in immunocytochemical studies and for identification and isolation via flow sorting of D4 expressing cell types
that targets rat PTP1B DNA, and which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Screening for compounds that selectively bind to a rat D4 dopamine receptor (DDR), useful for identifying dopamine (ant) agonists, comprises exposing cells transfected with a nucleic acid encoding the DDR to candidate compounds.
                   phosphorothicate backbone and 2'-O-methoxyethyl wings, used in an

The present invention relates to methods and devices for tissue repair.

The devices have tissue-like characteristics for treating diseased or damaged tissue or for augmenting tissue in a subject. The device comprises cells of type(s) normally found in healthy tissue corresponding to the diseased or damaged tissue or in the tissue to be augmented, and/or its suitable progenitor cells in association with bioresorbable beads or particles, and optionally a gel and/or gel forming substance.

The cells and/or suitable progenitor cells are chondrocytes, embryonic teem cells, and/or bone marrow stromal cells. The devices and methods are useful for treating diseased or damaged tissue in a subject, such as articular cartilage degeneration associated with primary osteoarthritis, or or other articular cartilage damage caused by sporting injuries or trauma. They are also useful for tissue augmentation for cosmetic trauma. They are also useful for tissue augmentation for cosmetic.

The use of biodegradable polymers in the device offer advantages over non degradable polymers in the is less traumatic than previous art.

The use of biodegradable polymers in the device offer advantages over non degradable polymers in the device of for surgical removal of the scaffolds following restoration of the articular cartilage. Another advantage is its ability to be administered by injection if desired. The tissue regeneration is progressing, by offering physical support and resting amplify pig beta-actin cDNA, in the examples of the present
                                                                                                                                                                                                                                                                                              Pig; tissue repair; progenitor cell; bioresorbable bead; chondrocyte; gel forming substance; embryonic stem cell; bone marrow stromal cell; tissue damage; articular cartilage degeneration; primary osteoarthritis; articular cartilage damage; sporting injury; tissue augmentation; trauma; cosmetic; scar; facial wrinkle; tissue growth; osteopathic; antiarthritic; dermatological; PCR; primer; 88; beta-actin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New device having tissue-like characteristics, useful for treating diseased or damaged tissue, e.g. articular cartilage degeneration associated with primary osteoarthritis, or for tissue augmentation for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid molecule encoding rate of dopamine receptor. The rat D4 dopamine receptor binds dopamine antagonists such as clozapine. The nucleic acid is useful as a probe for related D4 dopamine receptors. The nucleic acid when expressed in cell lines, is useful as an in vitro screen for drugs which specifically bind to the receptor. Antibodies to the protein are useful in financytochemical studies, identification and isolation via flow sorting of D4 expressing cell types and in blocking or modifying the effects of D4 agonists and/or antagonists. The present sequence represents the rat dopamine D4 receptor reverse transcription (RT)-PCR primer, orD4-515, used for tissue distribution studies of the rat dopamine D4 receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel nucleic acid molecule encoding rat D4 dopamine receptor, useful as a probe for related D4 dopamine receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Rat; ss; primer; dopamine; D4; D4 receptor; D4 dopamine receptor probe;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a method for treating an autoimmune disease comprising co-administering to a patient a statin and an antigenspecific/non-antigen-specific immunomodulatory agent. The immunomodulatory agent has antidiabetic, antiarthritic and vasotropic activities, and can be used in gene therapy. The method is useful for treating autoimmune disease e.g., multiple sclerosis, insulin dependent diabetes mellitus (IDBM), rheumatoid arthritis or autoimmune uveitis. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             3-hydroxy-3-methylglutaryl coenzyme A synthase,BaySNP13191,PCR primer #6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Treating an autoimmune disease by co-administering to a patient a statin and an antigen-specific non-antigen-specific immunomodulatory agent.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                   The present invention relates to human phenotype-associated (PA) genes (I ; ADF13107-ADF13186) which contain a Single Nucleotide Polymorphism (SNP). The SNP is given in the sequence as a variant nucleotide. Also claimed are methods for screening for agents which regulate the activity of a PA gene and reagents that modulate the activity of a PA polypeptide or a polypucleotide where the reagent is identified by the screening methods and compositions of the present invention are useful for prognosticating, diagnosing and treating cardiovascular diseases, such as antherosclarosis, hypertension, restenosis, arterial inflammation, used in the examples from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A new nucleic acid encoding a rat D4 dopamine receptor is useful to treat disorders of the cardiovasculature or retinal tissue or prevent or treat disorders of neuronal morphology or connections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cardiovascular; ophthalmological; rat; D4 dopamine receptor; cardiovasculature tissue; retinal tissue; neuronal morphology disorder; neuronal connection disorder; PCR; primer; ss.

The present invention relates to a method for detecting Hepatitis B virus (HBV) covalently closed circular (ccc) DNA. The method comprises obtaining a sample of liver cells infected with HBV cccDNA virus from a patient, preparing at least one primer for applying to at least one end of the HBV cccDNA virus genome, where the probe comprises a dye duencher, and conducting a second PCR to bind at least one primer to at least one probe so that the dye and the dye quencher in the probe are separated allowing the HBV ccDNA virus to be detected through the dye. Also allowing the HBV ccDNA virus to be detecting cccDNA of HBV ccCDNA of the disclosed is a kit for the detection of HBV cccDNA of HBV ccCDNA in a patient. The method of the invention is useful for detecting cccDNA of HBV in the form of a HBV ccDNA genome from an infected liver cell and for providing cuidance to the patient undergoing long term anti-HBV therapy. The method is efficient, rapid, economical and highly sensitive in monitoring HBV CCDNA in infected human liver biopsies. The method is specific for HBV

The invention describes an isolated nucleic acid encoding a rat D4 dopamine receptor. The invention is useful to treat disorders of the cardiovasculature or retinal tissue or prevent or treat disorders of neuronal morphology or connections. This sequence represents a primer used to isolate DNA encoding the rat dopamine D4 receptor.

Primers AAV5109-V57110 amplify a 166 bp fragment from the EGF2-24 domain sequences found in exon 17. Notch3 is a transmembrane receptor protein involved in lateral inhibition and regulating developmental cascades of neurogenic genes. Mutated Notch3 proteins are thought to be involved in neurological disorders, especially of the crebral autosomal dominant arteriopathy with subcortical infarcts and leukoencephalopathy (CADASIL) type. Blocking expression of a mutated brotchi can be used to treat CADASIL or related disorders. (Updated on 25-MAR-2003 to correct PI field.)

sites of the calpain large subunit 1 gene exons

The calpain large subunit I gene located on chromosome 15 codes for a calcium activated neutral protease (CAMP3) belonging to the calpain family. Mutations in the gene induce limb-girdle muscular dystrophy (LGMD) 2 disease. The gene, and fragments of it, can be used in the prevention, treatment, diagnosis and detection of a predisposition to LGMD2 disease. Fifty sequences (AAT32464-509) are given in the mplification which correspond to the splice donor and splice acceptor

Detection of mutations in paraplegin gene helps in the diagnosis and treatment of various forms of HSP or other neurodegenerative conditions, such as Amyotrophic Lateral Sclerosis
                                                                                                                                                                                                                                                                                                   A novel protein associated to hereditary spastic paraplegia used for the diagnosis of neurodegenerative conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.

                                                                                                                                                                                                                                                        ä
                                                                                                                                          The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
Representative examples of inbozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment
                                  New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.

Sequence 19 BP; 3 A; 8 C; 2 G; 6 T; 0 U; 0 Other;

The invention describes an isolated polypeptide comprising any of 33 90-723 amino acid sequences (I) given in the specification or its mature form, a sequence that is at least 95 % identical to (I), or a sequence comprising one or more conservative substitutions in the amino acid sequence of (I). The polypeptide is useful for preparing a composition for treating or preventing e.g. cancer. This sequence represents a primer used to isolate DNA encoding a novel human NOV protein

New DAPK3 polypeptide, useful for preparing a composition for treating or

preventing e.g., cancer.

```
ribozyme (I) which cleaves RNA encoding a cytokine involved in ribozyme (I) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a cucleic acid segment encoding (I) (I) can have antipsoriatic, dermatological, cytostatic, antiseborrhaic, antidabetic, antisickling, cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, equamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, virreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detechment, and for treating and preventing carring such as keloid, adhesion and hypertrophic or hypertrophic burn carring such as keloid, adhesion and hypertrophic or hypertrophic burn control or seporation and carring seed in the
                                                                                                                                                                                                                                                                                                                                                            ö

```
The present invention describes an isolated nucleic acid (1) comprising a single nucleotide polymorphism (SNP) chosen from: (i) a nucleic acid of salmo salar SNPs, Oreochromis niloticus SNPs or Atlantic halibut SNPs; and (ii) a nucleic acid having nucleotide sequence that hybridises to (i), or its complement under highly stringent hybridisation conditions. Also described: (i) an isolated oligonucleotide (II) comprising at least 17 contiguous nucleotides of insolated oligonucleotide sequence of S. salar SNPs, or niloticus SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, cod
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel isolated nucleic acid molecule comprising single nucleotide polymorphism associated with fish, useful for forming PCR primers which are used for detecting single nucleotide polymorphisms in fish nucleic

```
The present invention describes an isolated nucleic acid (I) comprising a single nucleotide polymorphism (SNP) chosen from: (I) a nucleic acid of salmo salars SNPs, Oreochromis niloticus SNPs or Atlantic halibut SNPs; and (ii) a nucleic acid having nucleotide sequence that hybridises to (I), or its complement under highly stringent hybridisation conditions. Also described: (I) an isolated oligonucleotide (II) comprising at least of nucleotides sequence of S. salar SNPs, O. niloticus MnSs, O. niloticus microsatellites, Atlantic halibut SNPs, cod polymorphic sites and seabass polymorphic sites, or their complement; (2) a primer pair (III) suitable for use in PCR, comprising to (II) capable (C) a mplifying a nucleotide sequence chosen from S. salar SNPs and, O. niloticus microsatellites, Atlantic halibut SNPs, cod polymorphic sites and seabass polymorphic sites; and determining (MI) the corigin of fish sample comprising providing a parentage genotype database comprising a collection of candidate parent genotype database comprising a collection of candidate parent genotype database comprising a collection of the candidate parent genotype identifies to the sample genotype and one of the candidate parent genotype identifies contention of the sample. (MI) is useful for determining the origin of the sample containing nucleic acid molecule comprising SNP in a sample, which cardinolecting nucleic acid molecule comprising SNP in a sample, which cannot be contained that hybridises to (II) (II) is useful for detecting nucleic acid molecule comprising solution of the sample containing nucleic acid molecule containing nucleic acid solution of the sample containing nucleic acid molecule containing nucleic acid molecule cand molecule cand molecule containing nucleic acid molecule cand molecule containing nucleic acid molecule acid molecule containing nucleic acid molecule containing nuclei
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         sequence in a sample, comprising contacting the sample containing nucleic acids with one or more (II) which is derived from 0. niloticus microsatellite, 0. niloticus SNPs, Atlantic halibut SNPs, cod polymorphic sites or seabass polymorphic sites, and identifying a nucleic acid that hybridises to (II). (III) is useful for detecting nucleic acid molecule comprising a microsatellite sequence in sample. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Virucide; Hepatotropic; Gene therapy; ss; short interfering nucleic acid; siNA; hepatitis B virus; HBV; RNA interference.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

```

```
The invention relates to a short interfering nucleic acid (siNA) molecule that down-regulates expression of a hepatitis B virus (HBV) gene by RNA interferance or that inhibits HBV replication. Also disclosed are the following: (1) a method of modulating the expression of a HBV gene in a tissue explant; (ii) a method of generating a library of siNA constructs molecules; (iv) a kit containing a siNA molecule which can be used to modulate the expression of a HBV target gene in a cell, tissue or cyganism; and (v) a method for synthesising a siNA molecule. The siNA molecule is adapted for use to treat HBV infection, and comprises a sense and an antisense region, where the antisense region comprises sequence complementary to an RNA sequence encoding HBV and the sense region comprises the molecule is assembled from 2 nucleic acid fragment comprises the molecule sense region and the second fragment comprises the comprises region and the second fragment comprises the antisense region and the sense region and the connected via a linker molecule. Where sense region and the antisense region comprises and are covalently connected via a linker molecule. The linker molecule is a polynucleotides. In the reminal overhang and the antisense region comprises a 3'-terminal coverhang. The sink fund has hepstitis B virus the encoding HBV. The sink is useful for treating hBW. The sink is the sense region fragment of an encoding HBV. The sink is useful for treating human hepstitis B virus the encoding HBV. The sink is treating formations of functions for the sink for the sink is the sense fragion for the sink for the sink is complementary to RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New short interfering nucleic acid molecules which down-regulates expression of a hepatitis B virus (HBV) or which inhibits HBV replication, useful for treating human HBV infections or for characterizing gene function.
                                                                                                                                                                                                                                                                                                                                                                                                                     Morrissey D, Mcswiggen JA, Beigelman L;

New short interfering nucleic acid molecules which down-regulates expression of a hepatitis B virus (HBV) or which inhibits HBV replication, useful for treating human HBV infections or for characterizing gene function.

Claim 11; Page 47; 72pp; English.

The invention relates to a short interfering nucleic acid (siNA) molecule that down-regulates expression of a hepatitis B virus (HBV) gene by RNA interference or that inhibite HBV replication. Also disclosed are the collowing: (1) a method of generating the expression of a HBV gene in a cilenterence or that inhibits have expression of a HBV gene in a cilenterence or more sinal predetermined complexity; (iii) a cell containing one or more sinal molecules; (iv) a kit containing a sinal molecule which can be used to modulate the expression of a HBV target gene in a cell, tissue or companien; and (v) a method for synthesisting a sinal molecule. The sinal molecule is adapted for use to treat HBV infection, and comprises a sense and an antisense region, where the antisense region comprises sequence complementary to an RNA sequence encoding HBV and the sense region comprises the sense region and the sense region of the sinal antisense region of the sinal molecule, where sense region and the connected via a linker molecule, where sense region and the antisense region comprises a linker molecule. The linker molecule is a polynucleotide inner or a non-nucleocide influker. The sense region comprises a 3'-terminal overhang and the antisense region comprises a 3'-terminal coverhang and the antisense region comprises a 3'-terminal coverhang and the antisense region comprises a 3'-terminal coverhang and the antisense region comprises a cucleotides.

                                                                                                                                                                                                                                                                                                                                                                                                                                                          Virucide; Hepatotropic; Gene therapy; ss; short interfering nucleic acid; siNA; hepatitis B virus; HBV; RNA interference.
The antisense region 3'-terminal overhang is complementary to RNA encoding HBV. The siNA is useful for treating human hepatitis B virus infections, and for characterising pathways of gene function, e.g. to inhibit activity of target genes in a pathway to determine the function of uncharacterised genes in gene function analysis. The siNA molecules may also be used in clinical, industrial, environmental, agricultural and/or research settings. The present sequence represents 1 of 1504 HBV
                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New short interfering nucleic acid molecules which down-regulates expression of a hepatitis B virus (HBV) or which inhibits HBV replication, useful for treating human HBV infections or for characterizing gene function.
                                                                                                                                                                                                 ;
                                                                                                                                                                                                                                                                                                                                                                                                                                Hepatitis B virus short interfering nucleic acid (siNA) #1157.
